

### Chapter 4.5: Electric Motors, Variable Speed Drives

#### Short type questions

1.	<p>The resistance of a motor stator winding at 30°C is 0.264 ohms per phase. What will be the resistance of the stator winding per phase when the motor winding temperature is 100°C?</p> <p><b>Ans.</b> Stator resistance at 100°C = <math>R_1 \times [(235 + t_1) / (235 + t_2)]</math>  <math>= 0.264 \times [(235 + 100) / (235 + 30)]</math>  <math>= 0.334</math> ohms per phase</p>
2.	<p>Calculate the full load power factor of a motor with following operating details:</p> <p>Output power = 30 kW  Efficiency = 85%  Voltage (V) = 415 V  Full load current (I<sub>fl</sub>) = 58 A</p> <p><b>Ans.</b></p> <p>Full load power factor = <math>[\text{Input power} / (1.732 \times V \times I_{fl})] \times 1000</math>  Input power = output power / efficiency = <math>30 / 0.85 = 35.3</math> kW  Full load power factor = <math>[35.3 / (1.732 \times 415 \times 58)] \times 1000 = 0.847</math></p>
3.	<p>Calculate the percentage loading of a motor using the following data:</p> <p>Synchronous speed in rpm = 1500 at 50 HZ operating frequency.  Nameplate full load speed = 1440  Measured speed in rpm = 1475  Nameplate rated power = 11 kW</p> <p><b>Ans.</b></p> $\% \text{ Loading} = \frac{1500 - 1475}{1500 - 1440} * 100\% = 41.6\%$
4.	<p>Calculate the rotor I<sup>2</sup> R losses using the following data:?</p> <p>Slip = 4%  Stator input = 3000 W  Stator I<sup>2</sup>R losses = 100 W  Core loss = 50 W</p> <p><b>Ans.</b></p> <p>Rotor I<sup>2</sup>R losses = Slip x (Stator input – stator I<sup>2</sup>R losses - Core loss)  <math>= 0.04 \times (3000 - 100 - 50)</math>  <math>= 114</math> W</p>
5.	<p>What are the two main advantages of application of a variable frequency drive in an induction motor other than accurate speed regulation?</p> <p><b>Ans.</b> Two of the main advantages are</p> <p>(i) High operating power factor  (ii) Energy savings during part load operation for longer duration of time.</p>
6.	<p>Why the accuracy of the slip method is limited?</p> <p>The largest uncertainty relates to the accuracy with which manufacturers report the nameplate full-load speed. Manufacturers generally round their reported full-load speed values to some multiple of 5 rpm. While 5 rpm is but a small percent of the full-load speed and may be considered as insignificant, the slip method relies on the difference between full-load nameplate and synchronous speeds. Given a 40 rpm “correct” slip, a seemingly minor 5 rpm disparity causes a 12% change in calculated load.</p>

7.	<p>The nameplate details of the motor shows the motor is rated at 22 kW with efficiency 91%. The actual power measured was 13 kW. Estimate the percentage loading of the motor?</p> <p>Input power at full rated power in kW, <math>P_i = 22/0.91 = 24.2</math> kW</p> <p>Percentage loading = <math>13/24.2 = 53.77\%</math></p>
8.	<p>List down important factors required for successful implementation of variable speed drives for any application</p> <p><b>Ans.</b> The important factors required to be considered for successful implementation of VSD are:</p> <ul style="list-style-type: none"> <li>• Load type</li> <li>• Motor information</li> <li>• Efficiency and power factor</li> <li>• Protection and power quality</li> </ul>
9.	<p>List down various methods available for determination of percentage loading of an induction motor?</p> <p><b>Ans.</b> The following methods are available for determination of percentage loading of induction motors with their own advantages and disadvantages:</p> <ol style="list-style-type: none"> <li>1. By input power measurements</li> <li>2. By line current measurements</li> <li>3. Slip method</li> </ol>
10.	<p>Comment on estimation of efficiency of 3 phase induction motor at field?</p> <p><b>Ans.</b></p> <p>It must be clear that accurate determination of efficiency is very difficult. The same motor tested by different methods and by same methods by different manufacturers can give a difference of 2 %.</p> <p>Estimation of efficiency in the field can be done as follows:</p> <ol style="list-style-type: none"> <li>a) Measure stator resistance and correct to operating temperature. From rated current value, <math>I^2R</math> losses are calculated.</li> <li>b) From rated speed and output, rotor R losses are calculated</li> <li>c) From no load test, core and F &amp; W losses are determined for stray loss.</li> </ol>

### **Long type questions**

1.	<p>What are the points to be considered while evaluating the efficiency of motor?</p> <p>It must be clear that accurate determination of efficiency is very difficult. The same motor tested by different methods and by same methods by different manufacturers can give a difference of 2 %. In view of this, for selecting high efficiency motors, the following can be done :</p> <ol style="list-style-type: none"> <li>a) When purchasing large number of small motors or a large motor, ask for a detailed test certificate. If possible, try to remain present during the tests. This will entail extra costs.</li> <li>b) See that efficiency values are specified without any tolerance</li> <li>c) Check the actual input current and kW, if replacement is done</li> <li>d) For new motors, keep a record of no load input power and current</li> <li>e) Use values of efficiency for comparison and for confirming; rely on measured inputs for all calculations.</li> </ol>
----	---

2.	<p>What is the information needed to evaluate energy savings for variable speed application?</p> <p>1. Method of flow control to which adjustable speed is compared:</p> <ul style="list-style-type: none"> <li>○ output throttling (pump) or dampers (fan)</li> <li>○ recirculation (pump) or unrestrained flow (fan)</li> <li>○ adjustable-speed coupling (eddy current coupling)</li> <li>○ inlet guide vanes or inlet dampers (fan only)</li> <li>○ two-speed motor.</li> </ul> <p>2. Pump or fan data:</p> <ul style="list-style-type: none"> <li>○ head versus flow curve for every different type of liquid (pump) or gas (fan) that is handled</li> <li>○ Pump efficiency curves.</li> </ul> <p>3. Process information:</p> <ul style="list-style-type: none"> <li>○ specific gravity (for pumps) or specific density of products (for fans)</li> <li>○ system resistance head/flow curve</li> <li>○ equipment duty cycle, i.e. flow levels and time duration.</li> </ul> <p>4. Efficiency information on all relevant electrical system apparatus:</p> <ul style="list-style-type: none"> <li>○ motors, constant and variable speed</li> <li>○ variable speed drives</li> <li>○ gears</li> <li>○ transformers.</li> </ul> <p>If precise information is not available for all the above, one can make reasonable assumptions for points 2 and 4.</p>
----	--

### **Numerical type questions**

1.	<p>Calculate the annual cost savings of a 25 HP motor operating at 90 % efficiency compared to 85 % efficiency. Consider 8000hours of operation and a tariff rate Rs 4 / kWh.</p> <p>At 85 % efficiency:</p> <table style="margin-left: 20px;"> <tr> <td>Input electric power</td> <td>= <math>\frac{25 \times 0.746}{0.85}</math></td> </tr> <tr> <td></td> <td>= 21.94 kW</td> </tr> </table> <p>At 90 % efficiency</p> <table style="margin-left: 20px;"> <tr> <td>Input electric power</td> <td>= <math>\frac{25 \times 0.746}{0.9}</math></td> </tr> <tr> <td></td> <td>= 20.72 kW</td> </tr> </table> <p>Power Input difference = 1.22 kW</p> <p>For 8000 hours of operation and Rs 4/ kWh the annual cost saving is</p> <table style="margin-left: 20px;"> <tr> <td></td> <td>= <math>1.22 \times 8000 \times 4</math></td> </tr> <tr> <td></td> <td>= Rs. 39,040/ annum</td> </tr> </table>	Input electric power	= $\frac{25 \times 0.746}{0.85}$		= 21.94 kW	Input electric power	= $\frac{25 \times 0.746}{0.9}$		= 20.72 kW		= $1.22 \times 8000 \times 4$		= Rs. 39,040/ annum
Input electric power	= $\frac{25 \times 0.746}{0.85}$												
	= 21.94 kW												
Input electric power	= $\frac{25 \times 0.746}{0.9}$												
	= 20.72 kW												
	= $1.22 \times 8000 \times 4$												
	= Rs. 39,040/ annum												

2.	<p>Estimate the percentage loading of the induction motor with following data using input power method, line current method and slip method.</p> <p>Name plate details:</p> <p>Rated kW of Motor = 30 kW  Rated Amps = 55 A  Rated voltage = 415 V  Name plate efficiency = 92%  Name plate speed = 1440 rpm  No. of poles = 4  Frequency = 50 Hz</p> <p>Operating Data</p> <p>Measured speed = 1460 rpm  Input load current = 45 A  Operating voltage = 425 V  Input power = 20 kW</p> <p><b>Ans.</b></p> <p>a) input Power method</p> <p>Input power at full rated power in kW, <math>P_i = 30/0.92 = 32.6</math> kW  Percentage loading = <math>20/32.6 = 61.3\%</math></p> <p>b) Line Current Method</p> <p>% load = [input load current / Input rated current] x [Rated voltage/ operating voltage] x 100  = <math>[45 / 55] \times [415/425] \times 100</math>  = 79.9%</p> <p>c) Slip Method</p> $\% \text{Loading} = \frac{\text{Slip}}{(S_s - S_r) \times (V_r / V)^2} \times 100\%$ <p>Synchronous speed = <math>120 \times 50 / 4 = 1500</math> rpm  Slip = Synchronous Speed – Measured speed in rpm,  = <math>1500 - 1460 = 40</math> rpm</p> $\% \text{Loading} = \frac{40}{(1500 - 1440) \times (415 / 425)^2} \times 100\% = 69.9\%$
3.	<p>Determine the actual output power of an induction motor using the following data?</p> <p>No. of poles = 2  Frequency = 50 Hz  Rated voltage = 415 V  Name plate full speed = 2980 rpm  Measured speed at 423 V = 2990 rpm  Name plate rated power = 22 kW</p> <p><b>Ans.</b></p> $\% \text{Loading} = \frac{\text{Slip}}{(S_s - S_r) \times (V_r / V)^2} \times 100\%$ <p>Synchronous speed = <math>120 \times 50 / 2 = 3000</math> rpm  Slip = Synchronous Speed – Measured speed in rpm,</p>

	$= 3000 - 2990 = 10 \text{ rpm}$ $\% \text{Loading} = \frac{10}{(3000 - 2980) \times (415 / 423)^2} \times 100\% = 51.9\%$ $\text{Actual output power} = 51.9\% \times 22 = 11.418 \text{ kW}$																
4.	<p>Calculate the annual energy savings and simple payback from replacing an existing standard motor with premium efficiency Motor versus repairing a standard efficiency motor. The data given are:                  Motor : 15 kW, working hours: 8000 hr, <math>\eta_{\text{standard}} = 88.3</math>, <math>\eta_{\text{premium}} = 93.5\%</math>, % Loading = 75</p> <p><b>Ans.</b></p> $\text{Energy cost savings (Rs./year)} = \text{kW} \times \% \text{loading} \times \left[ \frac{100}{\eta_{\text{standard}}} - \frac{100}{\eta_{\text{premium}}} \right] \times \text{hrs/annum} \times \text{Rs./kWh}$ $\text{Simple Payback (years)} = \text{Price premium} / \text{Annual cost savings (in Rs)}$ <p style="text-align: center;"><b>Simple Payback Analysis for an average 15 kW, 1500 RPM, TEFC Motor Repair or Replacement:</b></p> <table border="1" style="margin-left: auto; margin-right: auto; border-collapse: collapse; text-align: center;"> <thead> <tr> <th style="text-align: left;">Description</th> <th style="text-align: left;">Parameter</th> </tr> </thead> <tbody> <tr> <td>Efficiency after Rewound of Standard Motor</td> <td>88.3%</td> </tr> <tr> <td>Efficiency of Premium Efficiency Motor</td> <td>93.5%</td> </tr> <tr> <td>Operating Hours</td> <td>8,000</td> </tr> <tr> <td>% Loading of Motor</td> <td>75%</td> </tr> <tr> <td>Average cost of rewinding, Rs.</td> <td>5,000</td> </tr> <tr> <td>Cost of new premium efficiency motor, Rs.</td> <td>40,000</td> </tr> <tr> <td>Utility Rate</td> <td>Rs. 4.0/kWh</td> </tr> </tbody> </table> $\begin{aligned} \text{Energy Cost Savings} &= 15 \text{ kW} \times 0.75 \times 8,000 \text{ hrs} \times [100/88.3 - 100/93.5] \times \text{Rs. } 4/\text{kWh} \\ &= \text{Rs. } 22,674.28/\text{year} \end{aligned}$ $\text{Simple Payback} = (\text{Rs. } 40000 - \text{Rs. } 5000) / \text{Rs. } 22,674.28 = 1.54 \text{ years}$	Description	Parameter	Efficiency after Rewound of Standard Motor	88.3%	Efficiency of Premium Efficiency Motor	93.5%	Operating Hours	8,000	% Loading of Motor	75%	Average cost of rewinding, Rs.	5,000	Cost of new premium efficiency motor, Rs.	40,000	Utility Rate	Rs. 4.0/kWh
Description	Parameter																
Efficiency after Rewound of Standard Motor	88.3%																
Efficiency of Premium Efficiency Motor	93.5%																
Operating Hours	8,000																
% Loading of Motor	75%																
Average cost of rewinding, Rs.	5,000																
Cost of new premium efficiency motor, Rs.	40,000																
Utility Rate	Rs. 4.0/kWh
